[Native Dependencies In Android Studio 4.0](#)

Android Studio 4.0 is Now Available For Download With a New Motion Editor, Build Analyzer and More

Google has launched the latest version of its IDE (Integrated Development Environment), Android Studio 4.0 in May 2020. This release is supposed to help app developers 'code smarter, build faster, and design apps'.

Android is a huge platform with more than 2.5 billion monthly active devices. Though developers can use other IDEs to develop on Android, the latest features appear first in Android Studio. Google had released Android Studio 3.5 last year in February with very few new features, rather focusing completely on performance improvements and stability, which was known as Project Marble. Android Studio 4.0, on the other hand, includes a massive wave of new features. This version number 4.0 is suggested to be a major launch for anyone who develops apps and games for Android.

The most interesting features that developers would find in the latest version are new tools to help in designing the apps. It includes a new Motion Editor, a Build Analyzer, and Java 8 language APIs. Google also revamped the CPU Profiler user interface and enhanced the Layout Inspector.

The new Motion Editor lets you build complex MotionLayout animations with the help of a simple click-and-drag interface, while earlier this required editing XML files manually. In the meantime, the Layout Inspector and Layout Validation tools allow you to preview the design of your app in 3D or across multiple screen sizes.

Below you will see Android Studio 4.0 features categorised by design, develop, and build. The latest version also includes the usual performance enhancements and bug fixes on top of the latest features.
